

Reunification

The Beginning of the Unification

In 1858 Abraham Lincoln said, “A house divided against itself cannot stand.” He was paraphrasing Luke 11:17 which, ironically is about fighting Satan. Some people look to Religion; some to Politics; some to Science; some to Activism under all these banners. Unfortunately, none of these avenues can succeed without a consensus & consensus is what we must have to save ourselves. Jesus also said “The Truth will set you free”; so maybe we can turn to the TRUTH & see if we can’t build a consensus there. What I propose is that I’ll give you a unifying theory of the Universe & in that way we can be unified in this one thought. We’ll call it “The Beginning of the Unification” & if you like the unifying theory of the universe, then we’ll see where we can go from there.

The two greatest stumbling blocks to understand are preconceptions & misconception; & while we all have plenty of both, we’re going to say that $E=MC^2$. We’re going to hold that to be a TRUTH. We’re also going to say that Einstein was right when he said that you can have “Energy”, which is “E”; or you can have “Matter” or “Mass” which is “M”, but that neither can be destroyed. That one can be made into the other; but neither can be destroyed. We’re also going to say that for every action, there is an equal & opposite reaction. Those are our three truths. Those are our three preconceptions that we’re going to begin with. Let’s begin with $E=MC^2$. E= Energy & according to Einstein, any given amount of Mass multiplied by a “Constant”, C, Squared, will give you the amount of energy contained in that Matter. Now the “Constant is the speed of light: 186,000 miles per second. It could be in any means of measurement, but in the end the number is the Speed of Light Squared; & that’s going to be very important later, so you remember that. What’s important for now is that if you divide both sides of the equation by C^2 you end up with $E=M$. In

other words there are 2 things in the Universe. There is Energy & there is Matter or Mass & the amount of Energy you get from Matter can be determined by figuring the Speed of Light into the equation.

OK, moving on. When they show us gases accumulating out in the Universe, out in some far & distant galaxy, & they say that someday these gases will collapse & build new planets & Stars; they may very well be right. But what they have yet to show, because they can't show, is a place in the Universe where there was nothing but Energy one day & the next day there was Matter. The reason they've never showed you new Matter out in the Universe is because we're in a linear situation here. That is to say, the Universe is unraveling. Eventually, all the Matter in the Universe will become E, because all the Matter is breaking down into E, but there's no E being consolidated into Matter.

OK, let's back up here a bit. Have you ever heard of "The Singularity"? Well if you haven't, "The Singularity" is the basis for "The Big Bang Theory"? You see when Einstein figured out how the atoms worked, he did it by watching the Planets. That's because the Universe is built to scale. The same way that the atoms move around, is the same way that the Universe, the Planets, the solar systems, all of that is based on the same stuff. I think it was Mercury that he watched in its orbit around the Sun & he calculated it & that's how he came up with $E=MC^2$. The problem was that when he figured out the original equation it had a little "adjustment" on the end of it. Every time he figured out $E=MC^2$ & looked to see where the planet was in its orbit, it was off a little bit; so he would have to adjust his equation by this little trailer. Then along came a guy named Hubble. He got to looking out into the Universe & he said, "Wait A Minute, everything is expanding: the whole Universe is expanding; isn't that someth'in". "Not only that; the further things are away from me through my telescope, the faster they're expanding, the faster they're moving away. The further they are away, the faster they're moving away." Well when Einstein heard that he said "Well there you go. Biggest mistake of

my life. I don't need this little adjustment on my equation. The reason the Planet's not in the right place is because the Universe is expanding & $E=MC^2$ stands on its own."

So back to the "Singularity" again. All the atoms that make up Mass, the atoms that make up everything around you, are just like the Planets in the orbit around the Sun. There're almost all Noth'in". Just as the Planets orbit around the Sun in a great void in between the Planets, so too the electrons & protons that orbit around the atom operate in a void. There's just hardly anything there. They're like little specks moving around just like the Planets move in their orbits. The difference is that they move so fast that they seem to be solid, but they're not. So that what the Scientists did was, they said OK, let's run this film backwards. Let's collapse all of the atoms within the Planets until mathematically we take it back the beginning; till we can collapse the whole Universe onto the head of a pin; & they called it the "Singularity". But when they got the "Singularity" none of the rules held up anymore. None of the things that make the Universe work, worked & that's where the "Singularity" stumped them & that's was kind of the end of that line of thinking; it didn't make sense to 'em. Now what they say today is that when the Singularity let loose, when it exploded in "The Big Bang", it didn't come out from an epicenter & explode outward. They say it exploded everywhere all at once. Now that doesn't happen in Natural Law. So what they've done is they've used a "Supernatural" explanation in order to avoid the possibility of a center of the Universe. They also say there is no center of the Universe.

OK, so lets talk for a moment about perception & preconception. I want you to make a couple of mental images for me. The first one's a sponge. If you've ever taken a sponge & set it on a wet surface when the sponge was dry, you've watched it expand. Now I want you to imagine that same sponge & its round. It's a ball & its dry & its in a very humid place. So that it's taking on moisture & it's taking on moisture clear through the sponge. It's a very strange place, but in this place the sponge collects moisture

all throughout the sponge; not just on the surface inward, but everywhere all at once: & I want you to focus your mind on the center of that sponge. OK, now watch it expand. It's expanding in all three dimensions, from; well not from the center according to Science; it doesn't have a center any more. It's a little hard. Imagine that this sponge is the size of the Universe & somewhere inside there, somehow the center has disappeared. That's hard to believe isn't it?

OK. Next exercise, lets think about, if you've ever been around an electric stove that was hot enough that you put your hand on it & you got burnt, but you couldn't tell that it was hot until it burnt you? Well that's because the metal had energy in it: "E". It was brought there as an electrical current & its got a lot of energy in it, & it will: too much energy put against your skin will corrupt all the vessels that touch it & hurt you a lot. OK, but now as we add more energy to it, more "E", you begin to feel the heat at greater distances from the burner & then as it gets even hotter it begins to glow. So by adding more "E", or energy, we've gone from a "State" in which the metal was hot & radiating heat; to a "State" where now it's radiating heat & light: & while you can still only feel the heat from a certain distance, you can see the light from much further away. As a matter of fact, if we took the atmosphere out from around that light like we do in a light bulb, if we were to put that metal in a vacuum we could get that metal hot enough that it would become white light & we could see it at great distances. It's all the same energy; it's just a question of how much of it there is & how fast it moves away from that source. Once it reaches light speed, it moves pretty quick & pretty far.

OK; now the last image I want you to think about is you, & your standing out in the middle of nowhere. It's just you & pitch black. There's no stars, no city, no moon, just blackness except that just off to the side of you, just a few dozen yards away; there's a light pole & up at the top there's a bare bulb. Now there's noth'in else around, it's just flat ground; your out in the desert & you can see the light as it reflects from the ground; but you can't

see the light as it heads off in the other direction. You can't see it as it heads up toward space; but you know it's emitting energy. You know that light is passing in that direction, but you can't see it. So what happened to that light energy & what happen to all the heat that comes to Earth from the Sun. Does it just disappear? Back in time they used to refer to the area outside the atmosphere of the Earth as the "Ether". Then Scientists came up with a way to test for the Ether & they found that there was no such thing. The problem is that their test was faulty & ever since they tested & decided that there was nothing out beyond the perimeter of the Atmosphere, they've had a misconception & they've based much of what we believe today, on that misconception. So now, a couple of things that are essential to what I hope to share with you. Number one: we perceive the "Light Energy" that directly enters our eyes, but we don't perceive all the light energy moving away or across in front of us. If we did, we would be in a "White Out". We would be "Snow Blind" & unable to see anything. Number two: that light energy from the light pole isn't powerful enough to be seen from, say, the moon. It will dissipate just as heat from a stove top will dissipate as it moves from the stove, but its not turning into "Matter" either. Remember now, Einstien said it can't just disappear. It cannot be destroyed. It can be converted, but it cannot be destroyed.

So where did it go? Well it's still there; that's the thing you see; & what I want you to think about now is the smallest thing in the Universe. There was a time when Science said it was the molecule. Then they decided that it was the Atom. Then someone decided you could tear apart an Atom & all of a sudden we had Protons & Neutrons; we have Electrons: now we have even smaller Particles: Atomic Particles & Sub-Atomic Particles. But what I'm going to suggest is the smallest thing there is in the Universe is "E"; Energy. That even though it can't be measured because there's nothing to measure it against & it doesn't have "Mass" by the definition of "Mass"; nevertheless, it does physically exist as a Particle & because it can never be destroyed , & because it's being

created all around us in the Universe, by every star in the heavens; that what we're swimming in is a sea of "E". It's not unlike the little kid's pool of balls down at "Chucky Cheese". What's more, because of the large number associated with the amount of energy that is created from "Mass": remember we have the speed of light squared, 186,000 squared: that's the amount of energy that comes out of Matter. So it's kind of like a kernel of popcorn popping. What was small when it was contained in the atom is huge when it explodes. Look at a nuclear bomb. That's what's making the Universe expand, is all this additional "E" that's being added to the pool: to the kiddy pool, to the balls down at Chucky Cheese. It then becomes a question of displacement. As you increase energy into the pool, other energy & other matter has to be displaced: therefore the Universe has to expand accordingly.

If this is true, then "Electricity" is really nothing more than a concentration "E" in flow. That is to say, that if you have enough "E" concentrated in the same way that water is concentrated in a pipe, then you can increase the volume, you can increase the flow, you can increase the pressure in the same way you can with water: which is incidentally' the metaphor that all electricians use when explaining electricity. 21:30

Electricity

So how would it work? Wikipedia describes a "Generator" as a device that uses "Mechanical" energy to create "Electrons". That's misleading. You've undoubtedly seen the vortex that develops as water is drained from a tub. Like a tornado, it is nature's way of speeding up the transfer of molecules. Tornadoes are moving warm air & cold air. The whirlpool in your tub is formed as water exits into the plumbing pipe. Interestingly enough, the whirlpool spins in one direction in North America & in the opposite direction in Australia. That's because it is the rotation of the Earth itself that facilitates the vortex. Water is H₂O that has a "medium" energy component. As ice it has a low component & as

a gas that component is very high. As a result water acts very much like electricity. As I said, Electricians explain electricity using plumbing metaphors.

What does this have to do with generators? Both generators & electric motors have “Windings” mostly made of copper because copper conducts electricity so well. As those windings spin around the core of a generator using that “Mechanical” energy to spin the windings around a magnet, the copper creates a vortex that gathers “E” from its surroundings & sends it speeding through a copper wire, which acts like a pipe, facilitating a speedy return to the Earth; referred to in the vernacular as “Ground”. Nothing Electrical functions without a “GROUND”. Electric motors function in the same way, only in reverse. So while I suspect “E” is moving at a rate of 32 feet per second, per second toward the Earth’s Core to power the Earth’s rotation, to be expelled as the Northern Lights at the speed of light (186,000 miles per second); the Earth’s crust is acting as the windings for the motor known as Earth. Earth is a giant motor propelled around the Sun by “E Pressure” resulting from a decomposing Universe & the gravitational pull of the Sun resulting from the generator/electric motor nature of the Earth in rotation. Once that vortex is created then its just like water in a line. If you could run a water wheel off a line full of water, then you can run an electric motor off a line full of “E”, or electricity. You’re not “Converting” “Mechanical Power” into “Electrical Power”, so much as you are using Mechanical Power to spin the motor’s “Windings” around a magnet, thereby creating a vortex that gathers “E” from the area surrounding the motor in the same way water leaves your tub in that vortex. The “E” is all around you & when it is low you feel cold. When it is above your body temperature you feel hot.

Light

In order to truly understand why “E” & electricity & light act in the way they do, lets look at the metaphor or the example of a

pool table. Imagine a rack of balls on a pool table. Imagine it's nice & tight: all the balls are touching & now you careen a cue ball into that rack. If everything hits just right the cue ball stops & that energy passes through all the balls & the ones at the extremities go off. That's a metaphor for the way light travels. Another way you've seen it happen is the example of the five steel ball bearings that are suspended from strings. One crashes into the end of the row & the one at the other end of the row takes off with the same amount of energy. That's how light moves. Because the Universe is one big "Chucky Cheese Ball Bath", if you punch energy at the speed of light into that bath of "E", you'll get a straight line that is much like those steel ball Bearings; & where ever that concentration of energy passes through if you're using a measurement device, it will show a "Wave" because it passes through in pulses & any time that that energy level rises it will be reflected in a wave.

Another way to look at is that you're standing in a stadium & on the other side of the stadium the people facing are doing "The Wave"; except that each time they stand up to do the wave, when they sit down, they sit over one seat. So that when there's a nuclear explosion on the sun, one little ball of "E" bumps up against another ball in a line & it moves towards Earth & everywhere else in the Universe along a straight line & it moves much like the people in the stadium & each time they get up & make wave they sit down in the seat to their right. At their far right you stand & when that little bit of "E" bounces off your eye you perceive it as light. That moves a lot of energy very quickly: but that "Process" of getting up & sitting back down is what "Limits" The Speed Of Light to 186,000 miles per second. If you contain that light with a black surface so it builds up then you'll feel the heat. If you reflect it with a mirror so that it doesn't build up you won't feel anything at all. You'll just see that impression of light as it beams off your eye. If it's too bright, if there's too much energy like someone welding, you'll burn your eyes: it's all relative.

Gravity

So in the case of electricity, if there's a lot of "E" in our atmosphere & there is because as we sail through space we're pushing up against "E" & that gives a certain amount of residual pressure, "E Pressure", & the Sun is sending heat down & that creates "E Pressure": but why does it want to go to ground? Well, again, the answer is that Earth & other planets are just like motors. The molten rock at the "core" of the Earth is the Core. The Earth's "Crust" is the windings that cause the Earth to spin & because energy moves at two different speeds, one through radiant heat & one at light speed; as the "E" is sucked toward the center, much like the electricity is pulled out of the air in an electric motor, it is ejected at the North Pole in the form of The Northern Lights. So that what you have is a sea of "E" drifting down at the relatively slow rate we call "Gravity" & as it presses against the molecules that are you, & passes between the atoms, it pulls you toward the center of the Earth. Pressure from on top or suction from below, however you want to look at it, that's what we call Gravity. It's a very slow process. But the Northern Lights, they're very violent: ask any scientist.

In such a scenario, there will be a certain amount of what might be called "Static" energy at the surface of the planet as "E" moves from passing through the atmosphere to moving through the Earth's crust. Because there is what might be seen as a "Lower Pressure Area" of "E" at the north pole as a result of "E" being expelled at the "Speed of Light"; that "Static "E" will be pulled toward True North in a phenomenon we call the magnetism of "Magnetic North". Metals that have a high concentration of "E" in their molecular structure will want to be drawn in the direction of the North Pole. Now I may have these two ideas turned around. It could be that magnetism is created in a magnet by a low relative "E" or a high relative "E" & the opposite; which ever is true for

magnetism is what you find in the metals that are attracted by the magnet.

If my suppositions concerning Gravity are true, then all “E” within the gravitational field of the Earth’s core is moving toward that “armature” at the center of the earth. As a condition of the spherical nature of that “E” field amassed around our planet, the “Cubic Area” within that field is shrinking as “E” is forced to speed up increasingly the closer it gets to the planet’s surface to accommodate the “E” which is following from the edges of the gravitational field. If this is true, then the well-accepted compilation of “32 feet per second, per second”, which is the increase in speed of a falling object due to gravity, should offer a mathematical correlation to the amount of acceleration necessary to remove material from a sphere as that sphere is reduced in area. Put another way, when a weather balloon is released from the Earth’s surface it will continue to expand as it rises as a result of decreased Barometric Pressure” being placed against it as it rises through the ever thinning atmosphere. In this case it is a function of the molecular nature of the atmosphere. As the molecules become less dense as the balloon rises into the outer reaches of our atmosphere the gas in the balloon is allowed to expand against an ever-decreasing atmospheric pressure. “E” within a “Decreasing” area works in an opposite manner. As the area within the sphere we call our atmosphere decreases as a result of the nature of movement of “E” toward a central point at the center of that sphere, which can best be described as the “Windings” of the Earth’s crust as it rotates around the Earth’s “Armature” (the Earth’s Molten Core), the closer the “E” within that sphere is to the center, the faster it must move to get out of the way of the march of “E” behind it that begins just inside the end of Earth’s “Gravitational Pull”. In such a scenario a given particle of “E” beginning its journey from the edge of the gravity field at the outer edges of our atmosphere, where gravity is so weak that it is undetectable, to the armature of the molten core of our Earth, must increase its speed to maintain its place within the movement of the

surrounding “E”. Like water increasing speed as it circles the drain, that increase in speed is likely 32 feet per second, per second & likely has something to do with the fact that water circles the drain in the opposite direction of water in the US, down in Australia.

Gravity, as we perceive it is the relatively mild downward pressure created by “E” making its way through and around the molecular & atomic structures that make up our world, as it passes through the atmosphere & toward the Earth’s Core. It is a river of “E” that flows much like any other river. If you put your foot in a rapidly moving current without enough resistance to the force of that current being applied by the other foot, or a hand, or anything fastened tight, you will be swept away. Just so, without some solid material object, like the edge of a cliff to keep you from being swept away in the current of “E” we call gravity, you will “FALL”!

Sun’s Gravity

To understand why all the planets in our solar system are drawn to the sun we need a little different metaphor. Imagine that you’re sitting at the bottom of a river & you push a whole lot of water up stream under pressure with a water cannon, but you won’t stop the flow down stream. The Sun is constantly sending out a volume of energy at light speed. Again back to the metaphor of the pool table. Imagine that the rack that we started out with, that we slammed the cue ball into, imagine that those balls packed tightly together are slowly drifting across the table. That’s what happening to all the “E’, or energy, that is effected by the gravity of the Sun; except that it isn’t a two dimensional “Flat Rack” of balls: it’s the balls from down at Chucky Cheese that engulfs everything within the Universe. On the one hand the sun is ejecting light & energy at the speed of light & at the same time it is sending it out fast & so forcefully, it’s creating a sort of a vacuum at the Sun’s surface. So

that a volume of “E”, the “E Pressure” within our Solar System is drifting toward the Sun at a very slow & gravitational rate as apposed to the violent & fast rate of the light that’s escaping.

Now I know that’s kind of hard, so let’s go back to that pool table, only this time the balls in the rack extend from the sun to the end of the Universe. Yes there is an end to the Universe; we’ll get to that, & all the balls are in a flat plain. You don’t have to worry about three-dimensional. But there’s noth’in but pool balls end to end & as the sun pushes out cue balls, they hit the first one in the rack & it sends the “Charge” to the extremities of the Universe & each time it does, the balls move one seat over just like the people in the stadium, so that there’s a constant flow of energy at the speed of light away from the sun; but there’s also constant “”March”; a slow drifting of all the “E’ in the Solar System toward any gravitational source like the Sun. So there’s an “E Pressure” vacuum of sorts around the Sun & its created by all that power leaving the sun at light speed.

Now on a three-dimensional plain, around the Sun everything is creeping toward the center of the sponge, like balls on the pool table marching toward the Sun & We are on a straight trajectory. Our little motor that is the Earth is puttering right along using the energy from the Sun to spin on its axis just like any motor does & it stays on its trajectory in a straight line: but because the “E”, which is the fiber of the Universe, the “E” around the Sun is drifting toward the Sun because of the gravitational pull of the Sun; as we travel in our straight trajectory, we drift in the “E” toward the sun & when the amount energy that we use to propel ourselves in a straight line is exactly equal the “Drift” of “E” toward the gravitational pull of the sun, we maintain & sustain an orbit around the Sun.

Once you start looking at the Universe & the life we live in terms of being constantly flooded in a bath of “E Pressure” then everything changes; your perception of everything around you changes. The reason that things are solid or liquid or gaseous becomes apparent in the fact that the amount of “E” in & between

& around molecules has a effect on the status of elements. I'll give you an example.

If you want oxygen in a tank, or you want acetylene, you go down to the place where they get these gases from the atmosphere & they sell them in bottled form. The way they do that is they compress the gasses until they liquefy & each of those gases liquefies at a different pressure. That's because each molecule is set up with a different structure. A different way of holding "E" & a different amount of "E" maintained & withheld or released between its gaseous state & its liquid state. What's really going on is when they pump gas into that metal tank & pressurize it, the molecules are stuck inside that metal tank, but the steel that they use to make the tank is really just a filter & the "E" travels through it easily. The way you know that the "E" is traveling through it is that the tank under pressure is going to generate heat. When you put gas under pressure you generate heat. That's the "E" passing through the sieve of the metal & leaving the molecules behind. As that pressure increases & the amount of "E" is squeezed out of each of the molecules, each one finds it own liquid state at a certain pressure. That's why when water evaporates or when the coolant in your air conditioner evaporates, you feel the sensation of cold. That's because it's gathering up "E" again as it goes from liquid to gas & the energy that's in your body & around your body is affected by the loss of that "E".

BACK HOLES

Another thing that make sense when you look at the Universe in this way is "Black Holes". I want you to imagine that you're at the bottom of the sea. Not too far from the sea floor, but you're well, well under the water. Clear down there & you have a large explosive devise & you set that off & the water erupts in a spherical fashion creating a large hole in the ocean full of gas. But then it implodes & falls back on itself. Well, that's because of the immense weight of the water. But imagine that you're out in the

middle of the Universe. You're out in some distant Galaxy & you're a star & you explode & you're like that explosion at the bottom of the ocean & the bigger star, the bigger the void left behind: The bigger the Black Hole. Now there is "E Pressure" in space, so that you would expect the "E" to crowd back into that hole, but it only moves at the speed of gravity & there is no gravity in the Black Hole, so it's a state of osmosis that sees "E" begin to drift back into the void created by the explosion. What's more the Universe is expanding so that osmosis process, that "E Pressure" is diminished by the amount of the expansion of the Universe & when light passes by that hole in its straight line of steel balls, what little "E" does drift into that Black Hole breaks the chain in the steel ball bearings: in the line of light & the ball bearings kind of drift in & the straight line is broken & it appears that that Black Hole is sucking in light with gravity, but that's not it. You've just lost your straight line. The seats on the bleachers at the University game have been suddenly moved in the center so that the light doesn't travel in a straight line, it bows into the Black Hole & disappears. So while light bows around planets as a result of gravity, light appears to bow around Black Holes because of osmosis.

THE CENTER OF THE UNIVERSE

Now here's another misconception; the center of the Universe; & when you think about this, I want you to think about that sponge & about spherical objects. If the Universe is indeed unraveling, then the "E Pressure" is going to be at a variant. That is to say, as the Universe expands outward the "E" at the out reaches of the Universe is going to be thinner: under less pressure as it is spread out in the outer reaches of the expanding sphere we call the Universe. The only place that it's going to remain constant is at the center. Now Scientists, as of late, have been spending a lot of time & a lot of your money looking for what they call "Dark Matter"

because when they look out at distant galaxies they see that gravity doesn't react the way it should. It's not as strong as it should be & the only way they can figure that can be; or maybe its stronger, no I think its not as strong as it should be; because they're looking for an explanation in a matter they can't see. Mass gives gravity as far as they're concerned. They don't know why but were ever they find Mass they find gravity & therefore they think it causes it. But the reason they're looking for Dark Matter out there is because as you move away form the center of the Universe the "E Pressure" diminishes. As you move from the center of the sphere, even though the Universe is unraveling, because of the nature of the three dimensional spherical nature of the Universe, as you move away from the center, it's not going to be as dense as in the center. Conversely, at the center, if it weren't expanding, you'd overheat. You'd burn up from the build up of "E".

Which brings us back to Hubble. Hubble said that when he looked out into the Universe, the further he looked, the farther it was away, the faster it was moving away from him. Now he didn't say "When I look in this direction its moving away a little bit slower & then slower & that the other side is moving away faster & faster." He said, "When I look out into the Universe". That, my friends is because we are at the center of the Universe; & that's why we don't overheat & that's why our "E Pressure" is constant. & the reason we don't overheat is because the Universe is expanding from an epicenter: from a natural explosion in the natural world & as you move away from the center of the Universe & out into the far reaches of the far galaxies that these Scientists are looking at, your gravitational algorithms, or whatever you use to determine things are not going to hold up because the density of energy is not the same out there is it is here.

Remember, when Hubble discovered that the Universe was expanding & that the further away from US the faster it was expanding, he didn't qualify any given direction as moving away faster than any other. The only scenario in which all things are moving way from our position in all directions at a rate that

increases the further away from us it is, is one in which WE are at the center of that Universe. Moreover, because “E Pressure” is relative to one’s location near the center of the Universe wherein equilibrium is kept in balance by the unraveling of Matter & the release of “E”, as the expansion of the universe “Decompresses” the “E Pressure” in equal measure: moving away from the center of the Universe, we find that the relative “E Pressure” is reduced at the outer fringes of the Universe until the “Laws of Physics” as they exist in our World, no longer function in ways we understand.

As I stated at the beginning, the Universe is unraveling in a linear fashion. Someday everything that is Matter today will become energy. It will be “E” & there will be no Matter left. As the Universe expands from its original epicenter at the “Singularity”, it moves out in a spherical direction & the farthest point of the farthest bit of energy, or Matter, that exists from that epicenter is the end of the Universe & beyond that there is a void & that void is infinite. But the Universe is not. If it were there would never have been a “Singularity”, because if there were an infinite amount of matter, it wouldn’t make any difference if there’s big spaces in between the particles. If the amount of particles is infinite, there would never have been a “Singularity”.

To recap: remember that the Universe as we look out to ponder it, is the design that Einstein used to understand sub-atomic movement. Just as the planets and the stars move like specks within the universe, the components of atoms move as specks within their orbits. It is only the speed at which they sweep through their orbit that gives Mass the illusion of being solid. These realizations are at the core of the idea of the “Singularity”. But electrons do not travel in a void of space any more than do the stars in what science calls “Space”. “Space” as we define it does not exist within the parameters of the Universe. From its center, to the outermost dimensions of the expanding universe, all things, all Matter, swims in a soup of “E”.

I ask you to think for a moment of energy as tiny Styrofoam beads. To do that, you must divorce yourself from your perceptions

of energy. That is to say, that instead of looking at energy as a propellant or as the warmth you feel when standing near a fire or in the Sun; think of “E” as the smallest thing that can exist. Imagine that it travels through mass like X-Rays travel through your body. Imagine further that an X-Ray is a configuration of a wave of “E”. So that, just as an X-Ray travels through your body uninhibited by much of what it encounters, pure “E” travels uninhibited by anything other than pure “E”. The difference is that, as Einstein expressed in notes on “Relativity”, it is not “E” moving through Mass, but Mass that swims in a sea of pure energy, the fabric of the Universe.

I have explained Matter as a function of compressed “E”. When your local oxygen supplier sets out to fill oxygen tanks and hydrogen tanks and argon tanks, they begin by compressing air from the atmosphere. At given pressures, at given temperatures, gases become liquid and so elements can be separated out under controlled conditions. If the pressure is reduced subsequent to this initial action, at a given temperature, the reaction will be that the liquid will expand. Energy that was somehow compressed out from between the molecules as it passes from gas to liquid, will now be reintroduced as it passes back to gas. The reduction of energy in the surrounding area as a result, will lower energy levels. You will perceive the energy being withdrawn from your body as “cold”.

If these things are true, then the Universe is like a bag of popcorn in a microwave. The little Styrofoam balls that we swim through fill the void in which Matter exists. At the same time, Matter, in its compressed State as defined by $M=C^2$, displaces “E”. The “Kernel’s” amount of space displaced as “M” is not nearly enough to accommodate the expanded displacement potential of all those little Styrofoam balls that burst out when conversion from Matter to energy takes place.

Similarly, when light waves are configured, the waves move through the fabric of space until they hit something. What we perceive and measure as “Heat” is the increase in something like “pressure” in the amount of “E” present. This is why things expand

when warm and contract when cold. The process of Photosynthesis can then be explained along the lines of the forces that play in filling the oxygen bottles, only reversed. Calories, which are units of energy, are stored: trapped within molecular bonds. At given temperatures they can combust in a chain reaction we call fire. This process releases energy as the molecular bonds are broken down, which we again perceive as heat. Within our bodies these calories of energy are released in appropriate amounts to replenish the energy being lost. This process keeps equilibrium between the molecular structures that make up living things. Without enough energy the bonds do not hold. Just as dangerous is a situation in which too much energy floods in, washing away the bonds and releasing all the energy until all that remains is the carbon foundation. It is the molecular bonds, which somehow affect the retention of these free particles of energy. Clothing cannot retain energy any more that it might slow an X-Ray. But it can slow the movement of air molecules. Molecules that can in turn retain energy. The best molecule for retaining free energy is most likely the water molecule, H_2O . Which is why it is the basis of all life. It's probably why it is an excellent conductor of electricity.

If these things are the truth of the matter (no pun intended), then the expansion of the Universe is a function of an ever increasing volume of the fabric of the universe within the confines of the Universe's perimeter. Absolute zero does not exist except beyond the vale of the outermost frontiers of that expanding Universe and within its boundaries the amount of "E" within a given space and the subsequent relative "Pressure" it creates fluctuate relative to their proximity to the center of the Universe and the amount of energy converted from Matter that the area receives. My guess is that it is near the heart of the Universe that this "E-Pressure" is most constant. I am also inclined to believe that that is where you will find our little planet located.

When you hear my voice, what you're perceiving is the vibration of bones in your ear. That vibration was caused by "Energy": pure energy. That energy came from my body. It caused my vocal cords to vibrate, which in turn caused a sound wave to transmit through the air. Now I've recorded that sound wave & its been reproduced. It's probably been amplified. Nevertheless, what has traveled between you & I is pure energy.

I told you before we'd get back to the idea of the Speed of Light & what it has to do with $E=MC^2$ & a unifying theory of the Universe. Imagine that wave that we talked about; that human wave that stands up in the stadium seats. At one end, at your far right as they face you, at the end of every row, stands a person waiting for a seat & each person in that row stands up in order, as fast as they can & sits down in the seat next to them to their right, until at the other end of the stadium all the people have been displaced by one seat & someone is ejected out the other side. The fastest that can possibly happen with "Energy" is the Speed of Light. That's the "Natural World". That's the limitation. So now I want you to think about what could be called the "End of Time" as we know it. That place in the future where every last bit of Matter has disintegrated into "E", into "Energy" & the farthest reaches of the Universe have expanded to their full potential: it will be, at that point, exactly as it was in the beginning. What was the Alpha will become the Omega. All that will be left is the same "Energy" that makes heat & makes light & that makes words. So that in the beginning there was only the WORD; & I want you to imagine that instead of a "Supernatural" "Big Bang"; that it was a "Supernatural" event at the Speed of Light Squared that cause the "Singularity". That all the "E" that sat in the bleachers at the far right, found themselves encountered by "E" traveling at the Speed of Light Squared & that even though there was no gravity & there were no elements & none of things that make up the Universe: as that "E" was compressed into "Matter" at the Speed of Light Squared because that "E" could only move out of the way at the speed of light & not the speed of light squared; that the Alpha &

the Omega, the I AM, through sheer “force of “WILL”, arranged all the “E” into all the atoms & all the particles & sub-particles of atoms & HE arranged them in the right quantities & placed them in the right place, so when the “Singularity” let loose in a manner that was “Natural”, that did come from a epicenter & did expand outward, all would come to pass as it has & from that day to this, there has been an “Equal & Opposite Reaction” to the gathering together of “E” at the Speed of Light Squared & that equal & opposite reaction is the unraveling of Matter into “E” at a rate of the Speed of Light Squared.

Both John the Baptist & Jesus both said, in their time, that the “Kingdom of Heaven is at hand”. In fact Jesus told all His twelve apostles that the Kingdom of Heaven is at hand. They also said that the Kingdom of Heaven is in the midst of us & I take that to mean that Heaven has always been within reach if only Mankind would reach out for it. There are a lot of stubborn people out there who say that everything in the Bible has to be taken literally & unfortunately that has left them blind to a lot of things. But I want to give you one literal translation from Genesis before I leave. In this case, Clergy will fight a literal translation out of ignorance & hubris & vanity. “In the beginning God created the Heaven & the Earth & the Earth was without form & void & darkness was upon the face of the deep & the Spirit of God moved upon the face of the waters & God said Let there be Light & there was Light & God saw that Light, that it was good & God divided the Light from the Darkness & God called the Light Day & the Darkness He called Night & the Evening & the Morning were the first day. & God said Let there be a Firmament in the midst of the Waters & let it divide the Waters from the Waters & God made the Firmament & divided the Waters which were under the Firmament from the Waters which were above the Firmament & so it was. & God called the Firmament Heaven”.

I hope that you found this helpful. I would remind you that I am imperfect. Einstein said that light consisted of energy packets he called photons. If he was right, then light waves may represent

the ripple made in the fabric of the universe (the “E”), as photons pass through. But the key is this: if energy cannot be destroyed, it cannot be said that space is a void. Nor can “Science” show you the creation of Matter from Energy using Natural Laws. Still, you needn’t concern yourself too much with these arguments laid out with regard to $E=MC^2$. The true proof of God and of Jesus as The Christ, lie in the Bible’s ability to predict an outcome. I have given you enough information to find that proof if you will open your eyes and your hearts. But you must be open and you must become wise. Just as the meaning of $E=MC^2$ is altered by writing it $E=(MC)^2$, you must use caution when interpreting the Bible. When Genesis says, “and He made the stars also”, do not presume that He put the stars in heaven for He has called heaven the place between the waters above & below. It is you who have paired what is said about the lights of heaven and the stars. In the same way, Revelations speaks of a number being needed to make transactions. It does not say that it will always be the same number for all transactions. Perhaps it is your Social Security Number here in America when you buy a home or a bar code number when you buy a candy bar, or a taxpayer I.D. when you sell one. It says that some will wear the mark of God. It says that some will wear the mark of the Beast. But the mark of God is not mentioned in Revelations. It is foretold in the Old Testament Prophets. So that if you have not read all, you do not know all. It says that the number of the Beast is 666. But nowhere does it say that the mark of the Beast will be the number of the Beast. Nor can anyone deny that we have all been reduced to numbers. Just as likely, .666 is the numeric calculation of two-thirds, which is the percentage of Christ’s “Age (Birth to 3,000 AD) of which Satan has maintained his rule on Earth. That ends now, with Armageddon & the beginning of the rule of Christ with Satan cast “INTO” the “Bottomless Pit” for a thousand years.

Lastly, Webster’s dictionary gives several meanings for the word image. One is “a mental representation”. Another states “a general or public perception”. Webster’s also associates form and

‘semblance’ to the Biblical phrase “created in God’s image”. Perhaps they are right. That is certainly the common consensus. But the Bible says that every child has an Angel which passes before God: God who is good and who is love. I am inclined to believe that these things are the perceptions and the mental representation in which we are created by God. But life has a way of strangling the good and the love out of us as we grow from child of God, angel of God, to adult. At the same time, Jesus warned that you never know when it might be an angel you are in the presents of. Webster’s also defines image as the ‘embodiment’ of something. Be the embodiment of good and of love. Make yourself over in the image of God as He created you. Be open in your minds and in your hearts children of God and see, and live.

Now if you want to pursue what I’ve written, I’ll try to justify the first few lines of that Scripture. But according to “Job” the Waters Above are the Waters that rain down on US making the Waters Below the Waters that are in the rivers & the lakes & the seas; & the Firmament between the two is what God called Heaven & it’s at hand. It’s that “Sweet Spot” at the center of the Universe God’s Created as a home for all His Creation. But we have to be unified. If you find yourself unified in the theory of “Creation” based on the laws of physics & $E=MC^2$, then part of my job is done. This video is a compilation of the “E Book” “Unification”, from the audio file of the same name at ‘Thebookofanswers.us’; as well as excerpts from the book “Revolution Number Ten” & other writings for the purposes of re-editing & illustration. Thank you for watching. If you would like to learn more, all the writings of George Bailey can be accessed in one way or another by reading the posts of Georgebaileyrd @GETTR.

God’s Speed
